

## Lab Journal Going Native

### What I learned

- I learned some of JavaScript's built in functions that handle string manipulation.
- I learned how to concatenate strings in JavaScript
- That JavaScript is loosely typed
- How to implement conditionals
- How to implement switch structures
- How to implement for and while loops
- How to implement functions
- How to place my code in a separate file as opposed to inline html

### Challenges I overcame

- As always when learning a new language ( or relearning it ) I invariably mix up syntax with the last language I am in. I tried to do some Perl-ish and Java-ish stuff in my JavaScript code and that doesn't work out too well. Just part of the process though.
