

Lab get Informed

What I learned

- Prior to this lab I validated HTML forms through JavaScript or PHP, but now I think I will default to JQuery. The code is dead simple and robust coupled with CSS error highlighting its almost not fair. Go JQuery Validation
- Probably the most significant thing I learned from this lab is that JQuery Plugins are a valid form of web programming. I come from a PHP background so I sort of discounted all other web technologies. I always championed the HTML5 canvas tag because it was cool looking but now I am a champion of JQuery plugins because they make life easier.
- Another JQuery bullet point... but I think it's a good one. I have come to think of JQuery plugins as akin to #includes in heavy client apps. They are a tool like any other and they serve to enhance the application and the user's experience.
